

# HTML Forms

# Input (1)

---

`<input type="text">` or simply `<input>` is a standard textbox.

This can also have a value attribute, which sets the initial text in the textbox.

`<input type="password">` is similar to the textbox, but the characters typed in by the user will be hidden.

## Input(2)

**`<input type="checkbox">`** is a checkbox, which can be toggled on and off by the user. This can also have a checked attribute

(**`<input type="checkbox" checked>`** - the attribute doesn't require a value), and makes the initial state of the check box to be switched on, as it were.

**`<input type="radio">`** is similar to a checkbox, but the user can only select one radio button in a group. This can also have a checked attribute.

# Input(3)

`<input type="submit">` is a button that when selected will submit the form. You can control the text that appears on the submit button with the value attribute, for example

`<input type="submit" value="Ooo. Look. Text on a button. Wow">`.

Note that, like [img](#) and [br](#) tags, the [input](#) tag, which doesn't surround any content, doesn't require a closing tag.
